Journal of Geophysical Research . . . back volumes 1965, \$50; 1964, \$50; 1963, \$50; 1962, \$50; 1961, \$42; 1960, \$42; 1959, \$30.

Advertising: Send orders to Advertising Department, American Geophysical Union.

From January 1959 (Vol. 64, No. 1) through December 1962 (Vol. 67, No. 13) the *Journal of Geophysical Research* was published monthly by the American Geophysical Union. Semimonthly publication was begun in 1963 with the continuing support of the National Science Foundation and the Carnegie Institution of Washington. Division of the material according to subject matter was begun in 1964; papers on space and aeronomy are now published on the first of the month, and papers on the fluid and solid earth are published on the fifteenth.

The American Geophysical Union was established in 1919 by the National Research Council of the National Academy of Sciences as the National Committee of the United States for the International Union of Geodesy and Geophysics.

PREFACE

11270

Since the American Geophysical Union began publishing the *Journal of Geophysical Research* in 1959, approximately 4000 Articles have been published in it. The volume of this material has made it difficult to find all the articles related to a single topic, and the need for an index for this series of volumes has been increasingly urgent.

The index consists of two essential parts. The subject index is printed on the white pages and the author index on pink pages. Alphabetization is used throughout.

The type of index to be prepared was discussed over a period of two or three years, and several forms were considered: (1) a simple, traditional subject index, (2) a KWIC index based on the titles of the papers, and (3) a thoroughly comprehensive KWIC index based on the titles of the papers and key annotated words. The present index takes the second form. Comments on the adequacy of the index are invited to determine whether future indices should be more detailed, adding many annotated key words to the key words in the subject index titles. This kind of index involves much more effort on the part of authors, reviewers, and editors, and the cost would be greater. Would it be warranted?

There is a fourth possibility. The title of an article should be sufficient to indicate its contents. Journal editors might require authors to be as careful in selecting titles as they are in producing informative and concise abstracts. Key words would then appear in the title. This educational effort might be the ultimate solution, as forms (2) and (3) would then become substantially the same.

Consideration is being given to the problems discussed above and to whether or not an annual index should be produced. If an annual index is not produced, a combined table of contents by issue number and an index of authors will appear in the last issue of each year. These considerations will take into account the fact that in 1967 options for selecting journals to be received will be offered to members. Many members will not receive all the issues of *JGR*, some selecting the first issue of each month, and others selecting the second issue of each month. If the index is published annually, both issues in the last month of the year could contain the full index or, as an alternative, the last issue of the year, containing the index, could be sent to all members. The new option that members will have in 1967 will require that the

issue number be shown, so that those receiving odd- or even-numbered issues only can tell at once in which series a given paper appears.

ACKNOWLEDGMENTS

The set of the *Journal of Geophysical Research* used for the preparation of the data input and the annotation was applied by A. S. Furumoto. The keypunching of the input data cards was performed by Joyce Maynard and Joyce Higuchi. Roberta Kay Adams proofread the index. Annotation was primarily by Norman Wagner, F. Orrall, W. M. Adams, and others in the Hawaii Institute of Geophysics.

The computer processing was facilitated by discussions with Robert Rude and Girish Shah.

The characteristics desired for the index were defined in discussions with Philip H. Abelson, James A. Peoples, George P. Woollard, and Waldo E. Smith. They are responsible for discerning the need for a map through the maze of the *Journal of Geophysical Research* and for actively initiating this realization.

HOW TO USE THIS INDEX

William Mansfield Adams

This index consists of two sub-indexes: the Key-Word-In-Context (KWIC) index (a subject type of index) and the author index. For the Key-Word-In-Context (KWIC) index, certain key words are selected in each title. Each key word is listed, with the surrounding words in the title given as modifiers in the same order in which they appear in the title. The key words are listed alphabetically in column 25, not at the start of the line, so that modifiers appearing in the title before the selected key word may appear in the same position. To help the scanning of column 25, columns 1 to 23 are screened. If the title, when shifted so that the key word starts in column 25, extends beyond 60 characters, it is wrapped around (i.e., inserted at the beginning or end of the line).

PROCEDURE

Represent your interest by one or more words. Select the most important of the words and determine if it is among the key words listed alphabetically in column 25 of the KWIC index. If it is not listed there, look up the next most important word. Determine if there is a title containing more than one of your key words by observing the modifiers on the line at your entry key word. The location of a paper is indicated by the index code at the far right end of the line. The two digits between the two hyphens indicate the year of the article (the volume number is obtained by adding five); the last four digits are the starting page of the article. The letters in the index code are the first five letters of the first author's surname.

When the words in the title are inadequate to describe the concepts considered in the article, additional descriptive words have been added. These annotation words have been supplied by professional geophysicists, not by librarians. In the future, such annotation words will be provided by the authors.

The author index includes entries for all authors of all articles; co-authors are included. The reference indicates the year of publication and the beginning page number of the article.

If this explanation of the KWIC index is not clear, either ask a colleague who is familiar with KWIC to explain it to you or refer to the explanation in one of the following publications:

Chemical Abstracts, American Chemical Society, Washington, D. C., "Cumulative Index: Vol. 1-40, 1907-1946; 1947-()."
